ITP—Intelligent Text Processing

Aia ITP Software

Business Requirements

Do you want to create business-critical documents from within your enterprise applications? Do you want to automatically e-mail or print the documents? Do you want to deliver them in a variety of formats?

Solution Summary

Intelligent Text Processing (ITP) automates the production of documents from application data and can be fully integrated with any business application or data repository. Documents can be delivered in Microsoft Word and electronic formats such as HTML and Adobe Portable Document Format (PDF). ITP starts with a template called a model document, which is authored in Microsoft Word. Model documents contain text, layout, and ITP instructions, including data references, conditional logic, field formatting functions, and user interaction. The solution retrieves data from the referenced data sources, which can include Microsoft Office InfoPath™

2003 forms, Microsoft SQL Server™ databases, and XML Web services. The data is merged into the final document. Creation of the final document is done within ITP without using external scripts, macros, or applications. When the final document has been generated, it can be post-processed (for example, printed, e-mailed, or converted to another format). The solution can be integrated in business applications, such as back-office insurance applications. Aia Software offers ITP products for both workstation-based and server-based assembly processes. On user workstations, ITP provides information workers with an "automated secretary," offers a reliable and advanced data text merge, prevents the use of numerous standard documents, and automates the use of company style. On the server level, ITP enables the use of various data sources and the production of large batches (hundreds of thousands). It also helps organizations create multibranded output and produce modern output from legacy systems.
